

# ***Faecal pollution from land sources flushed by storm flows***

Recent research findings &  
current directions

*E. coli* –  
Indicator of  
faecal pollution

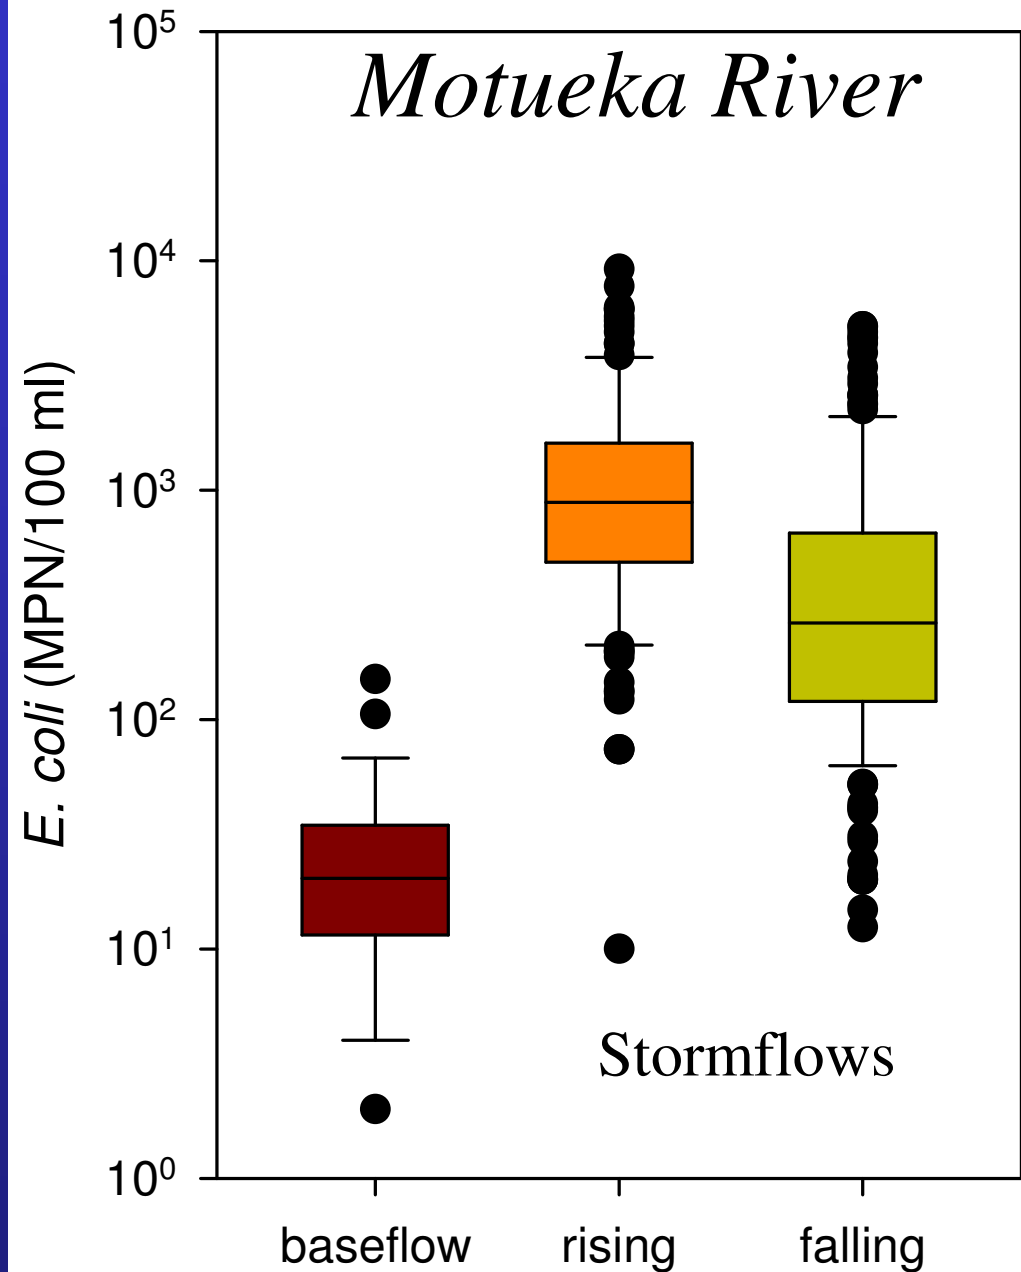

**Rob Davies-Colley**

NIWA, Hamilton

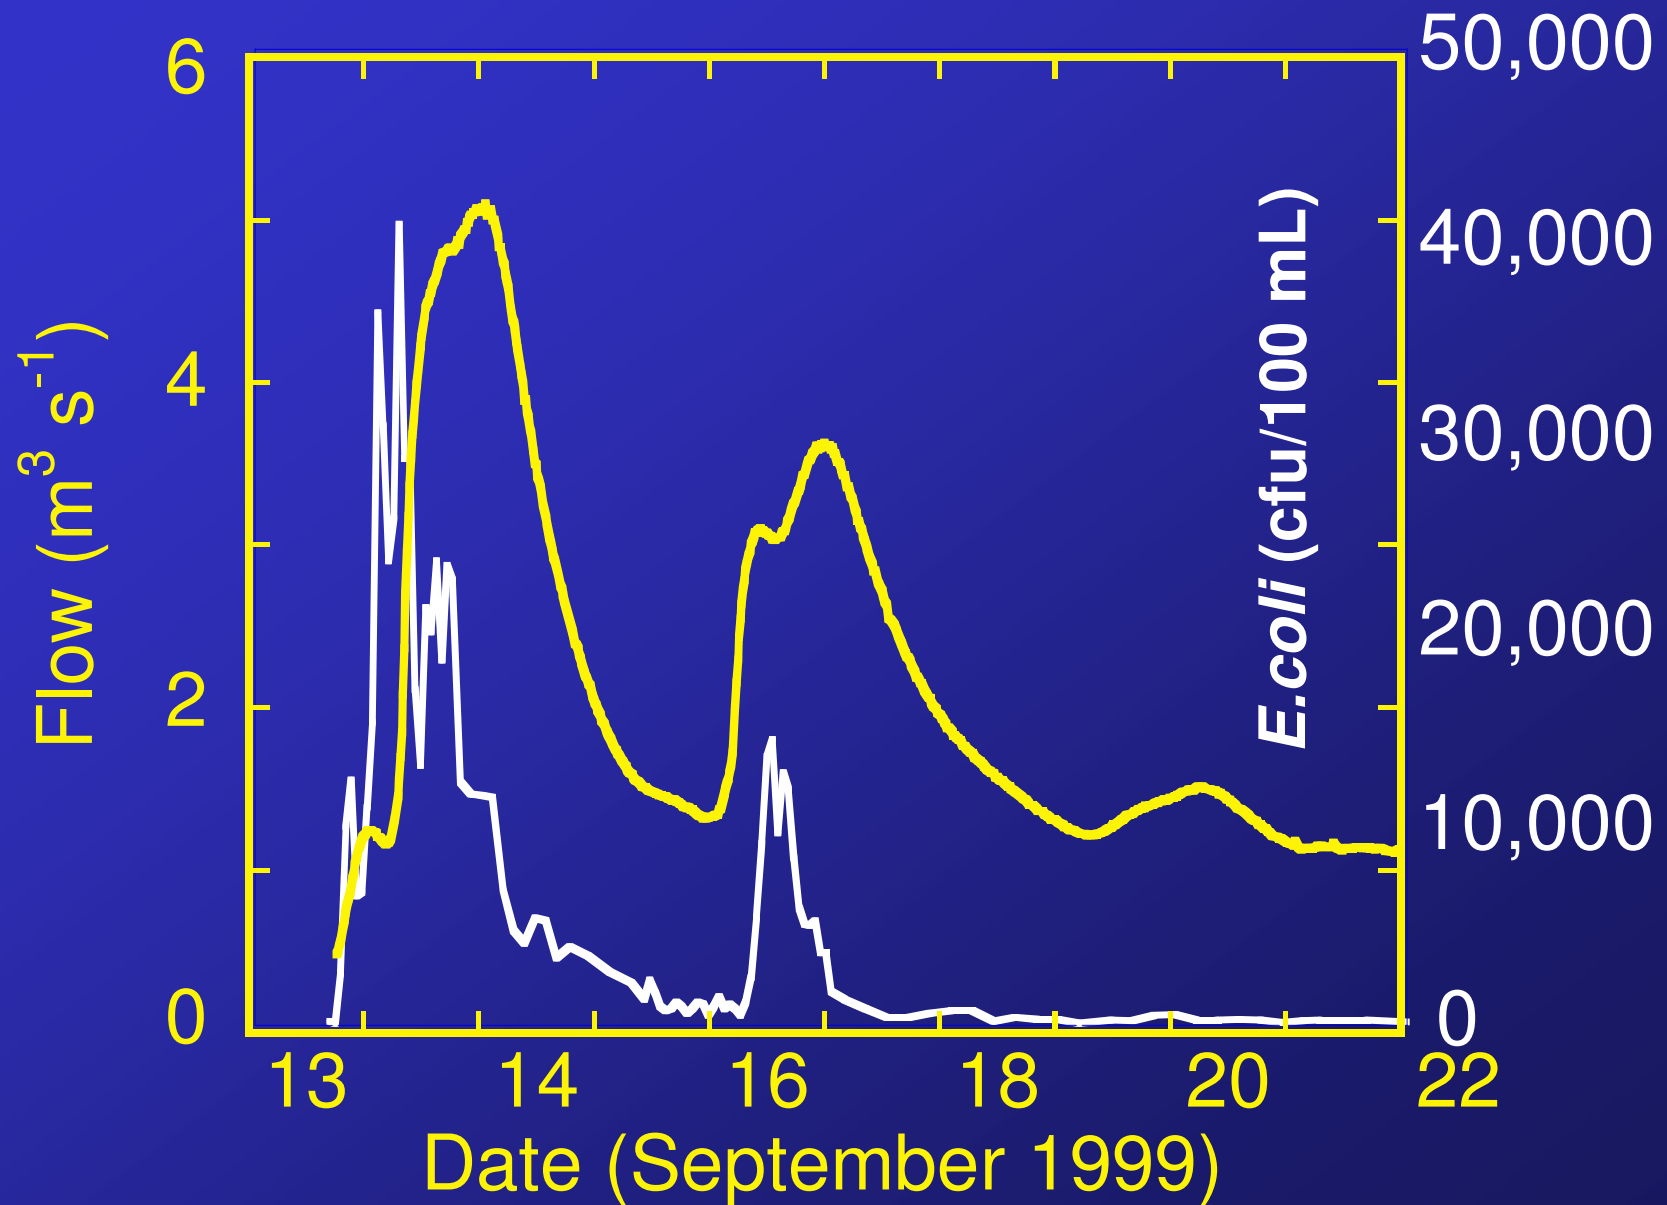

(and numerous colleagues from  
NIWA, ESR, AgRes, LCR,...)

## *Faecal pollution*

Much higher on  
floods than at  
baseflow – esp.  
on rising limbs

# Natural flood – flow and bacteria

# Overland flow – rainfall simulator

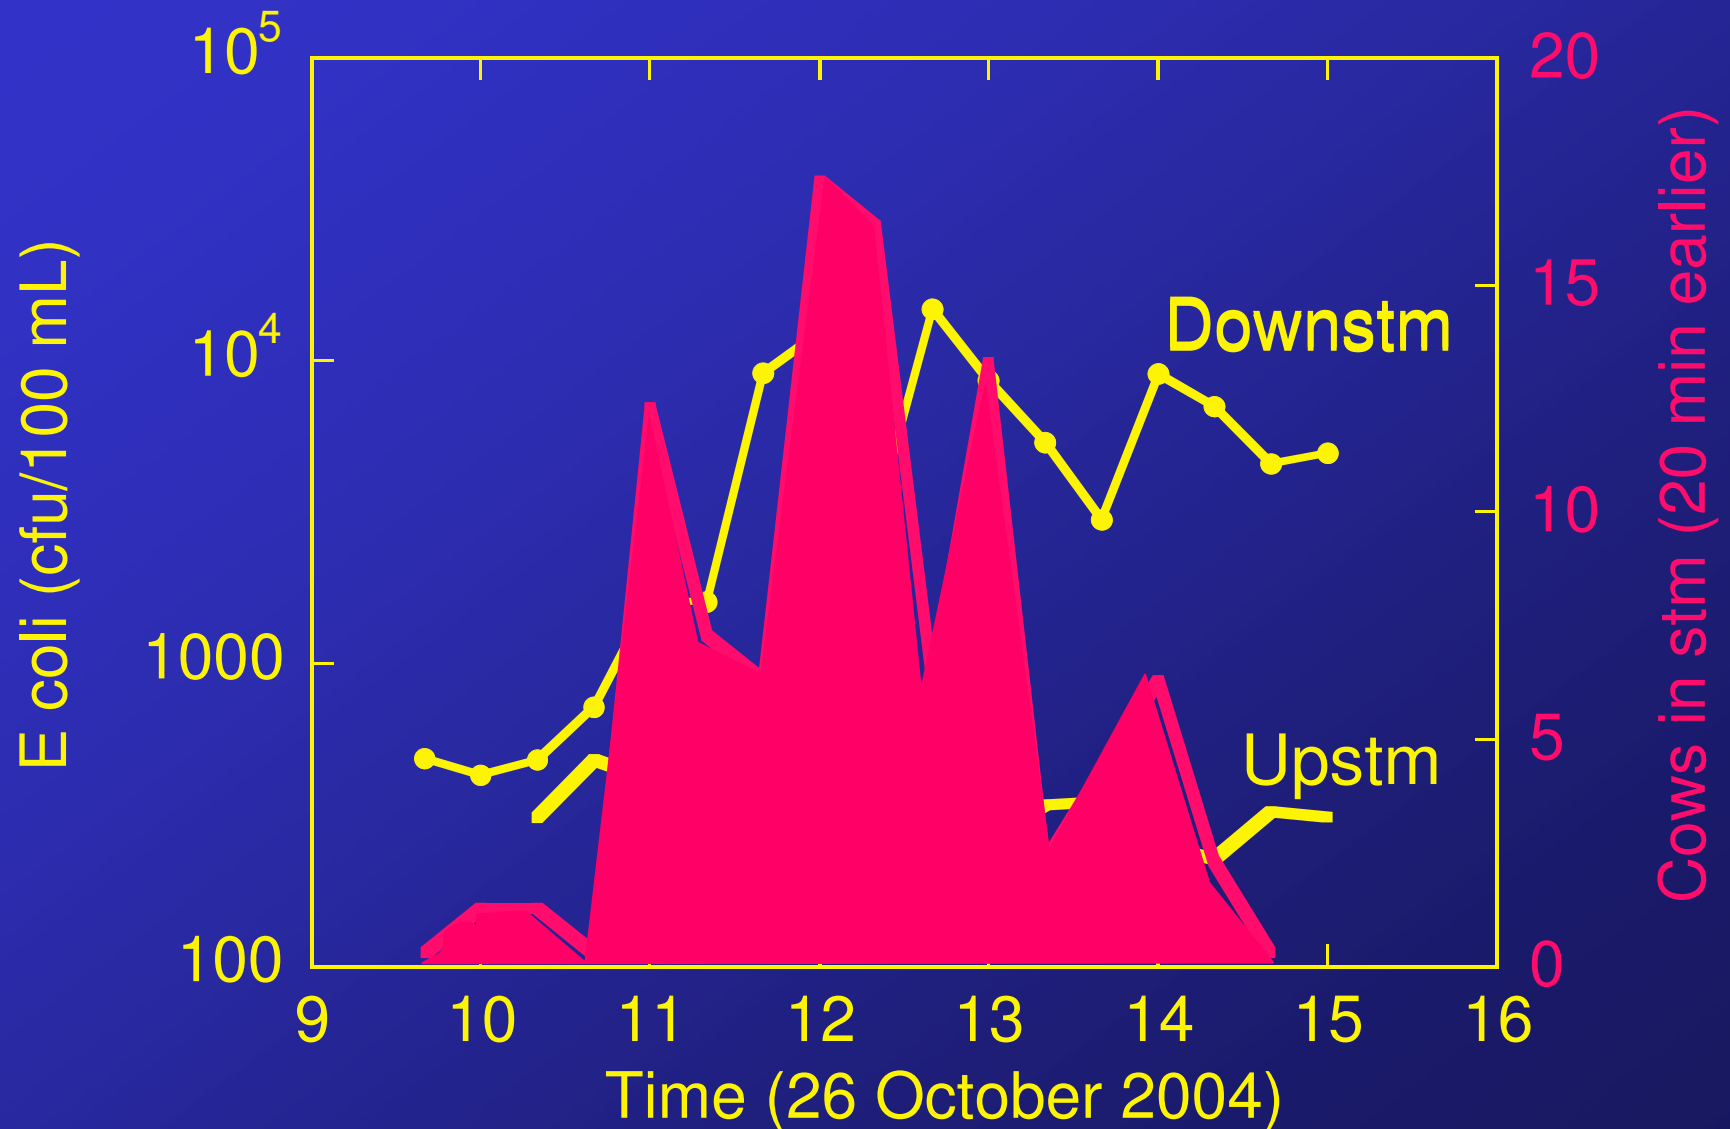

# Direct deposition – to unfenced streams

- **Dairy cow herd observed** - number in the stream and on the bank, recorded every minute.
- **Water Quality** (Turbidity *E. coli*) measured upstream and downstream.

# Direct deposition

# Agricultural stream sediments – *contain much fine sediment... and faecal microbes.*

*High concentrations  
of faecal microbes*

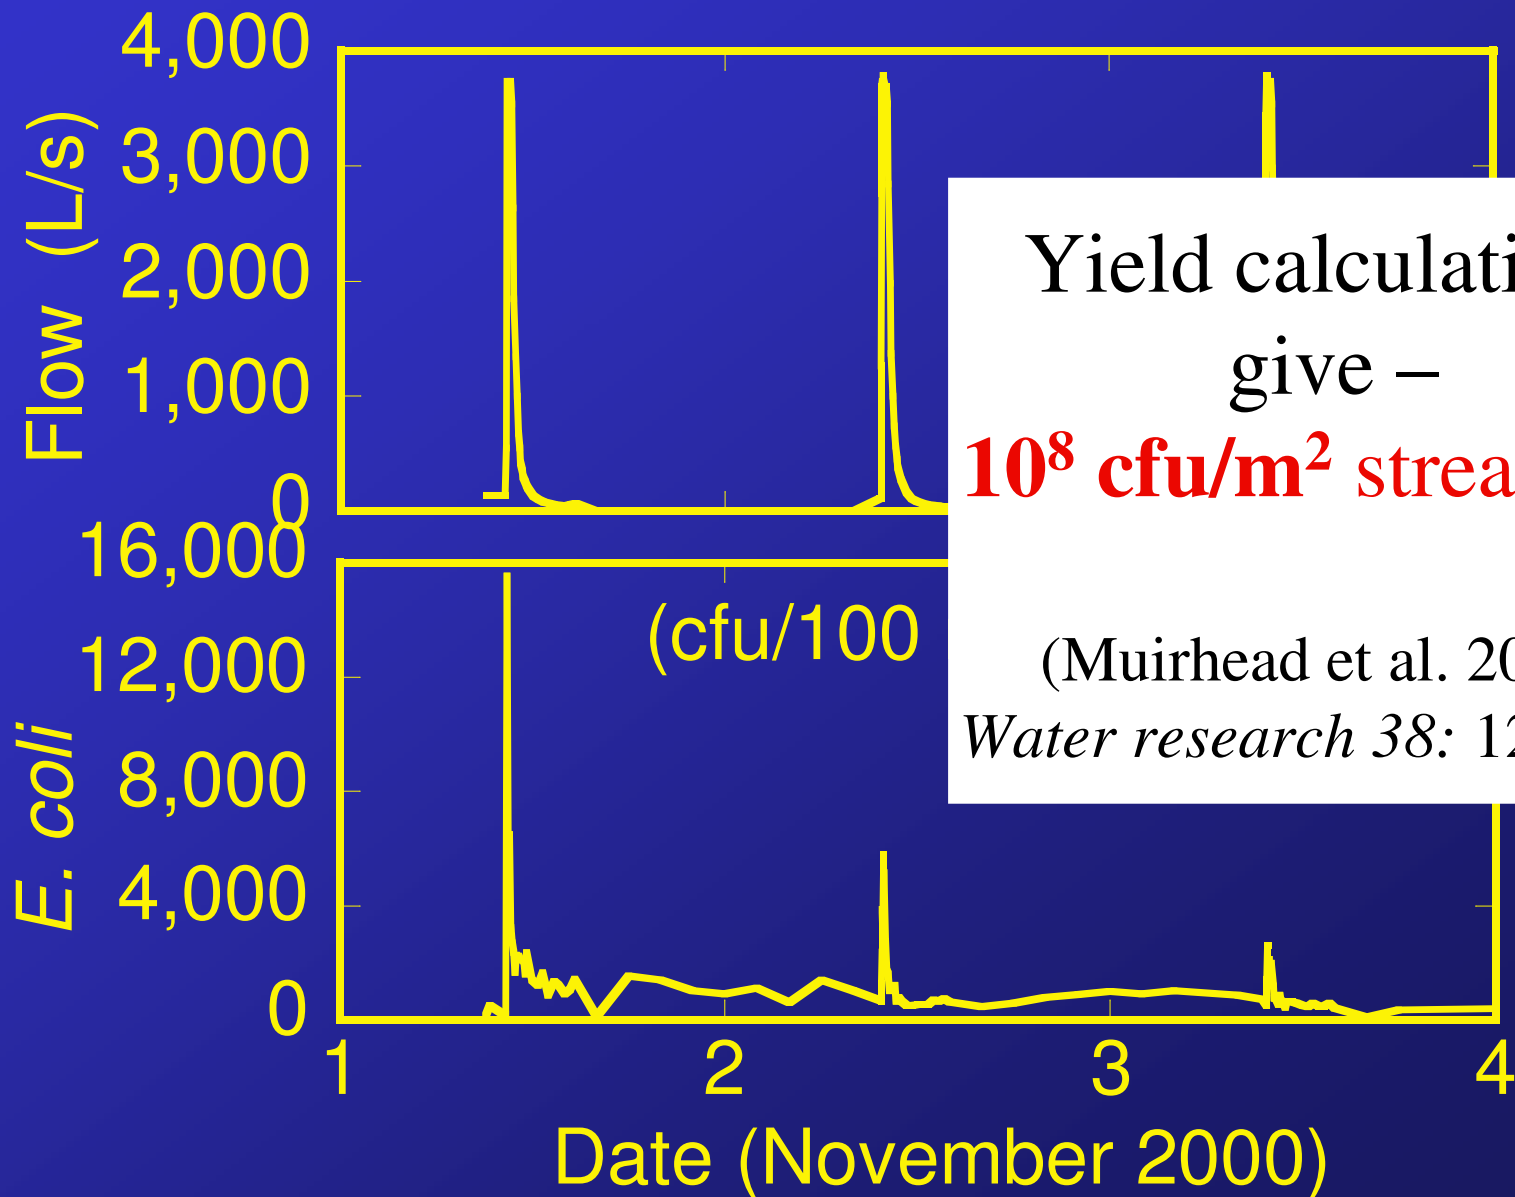

# Artificial flood – Topehaehae Stm

# Artificial flood – Topehaehae Stm

# Sediment sampling (Topehaehae Stm)

Areal concentration  
 $1.5 \times 10^8$  cfu/m<sup>2</sup>

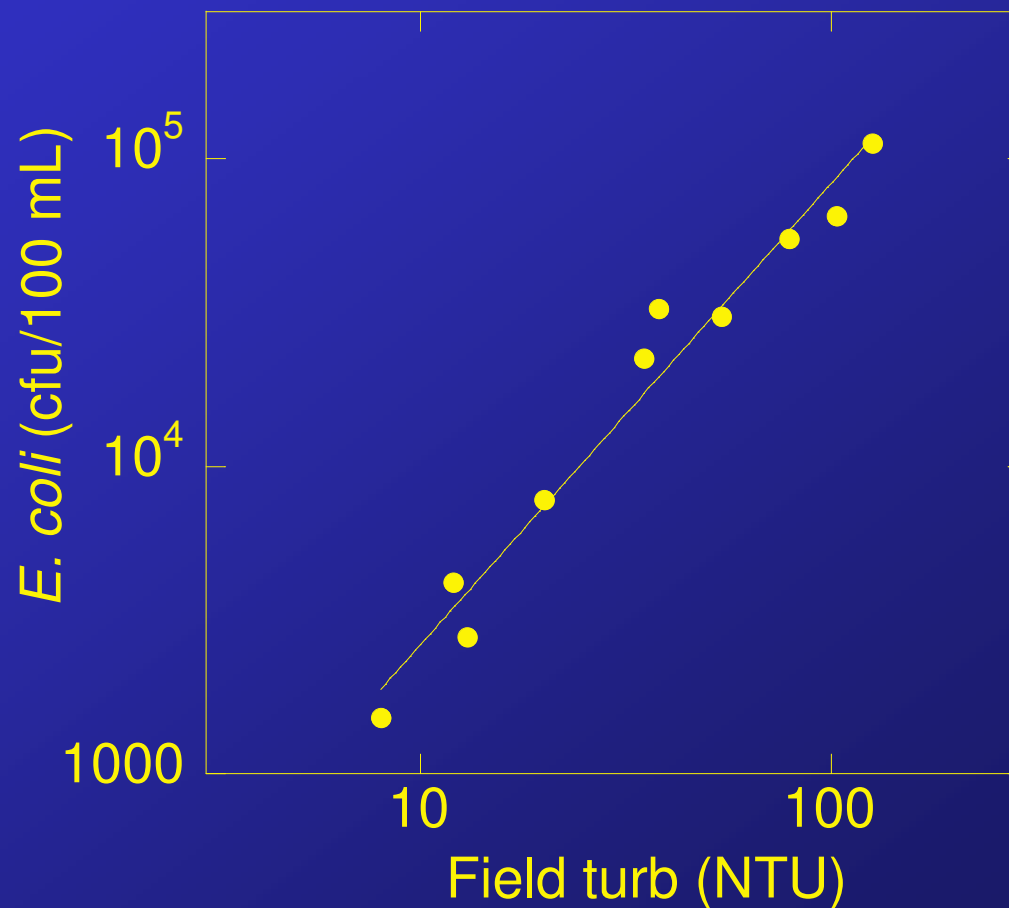

# Toenepi Stm (intensive dairying)

*Stormflow  
faecal  
bacterial  
dynamics &  
yields*

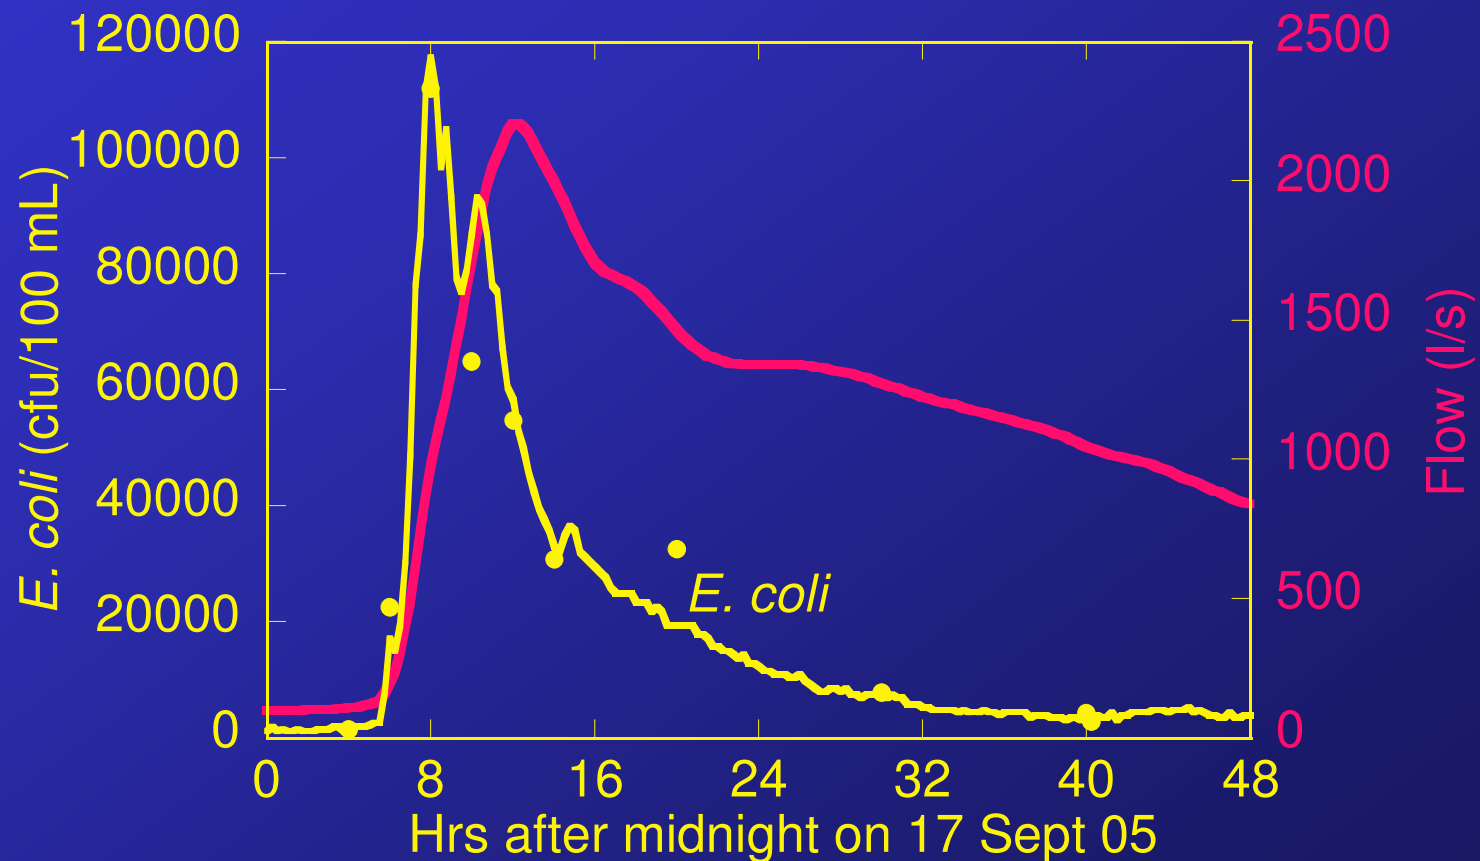

# *E. coli* vs turbidity

Toenepi – 18 September 2005

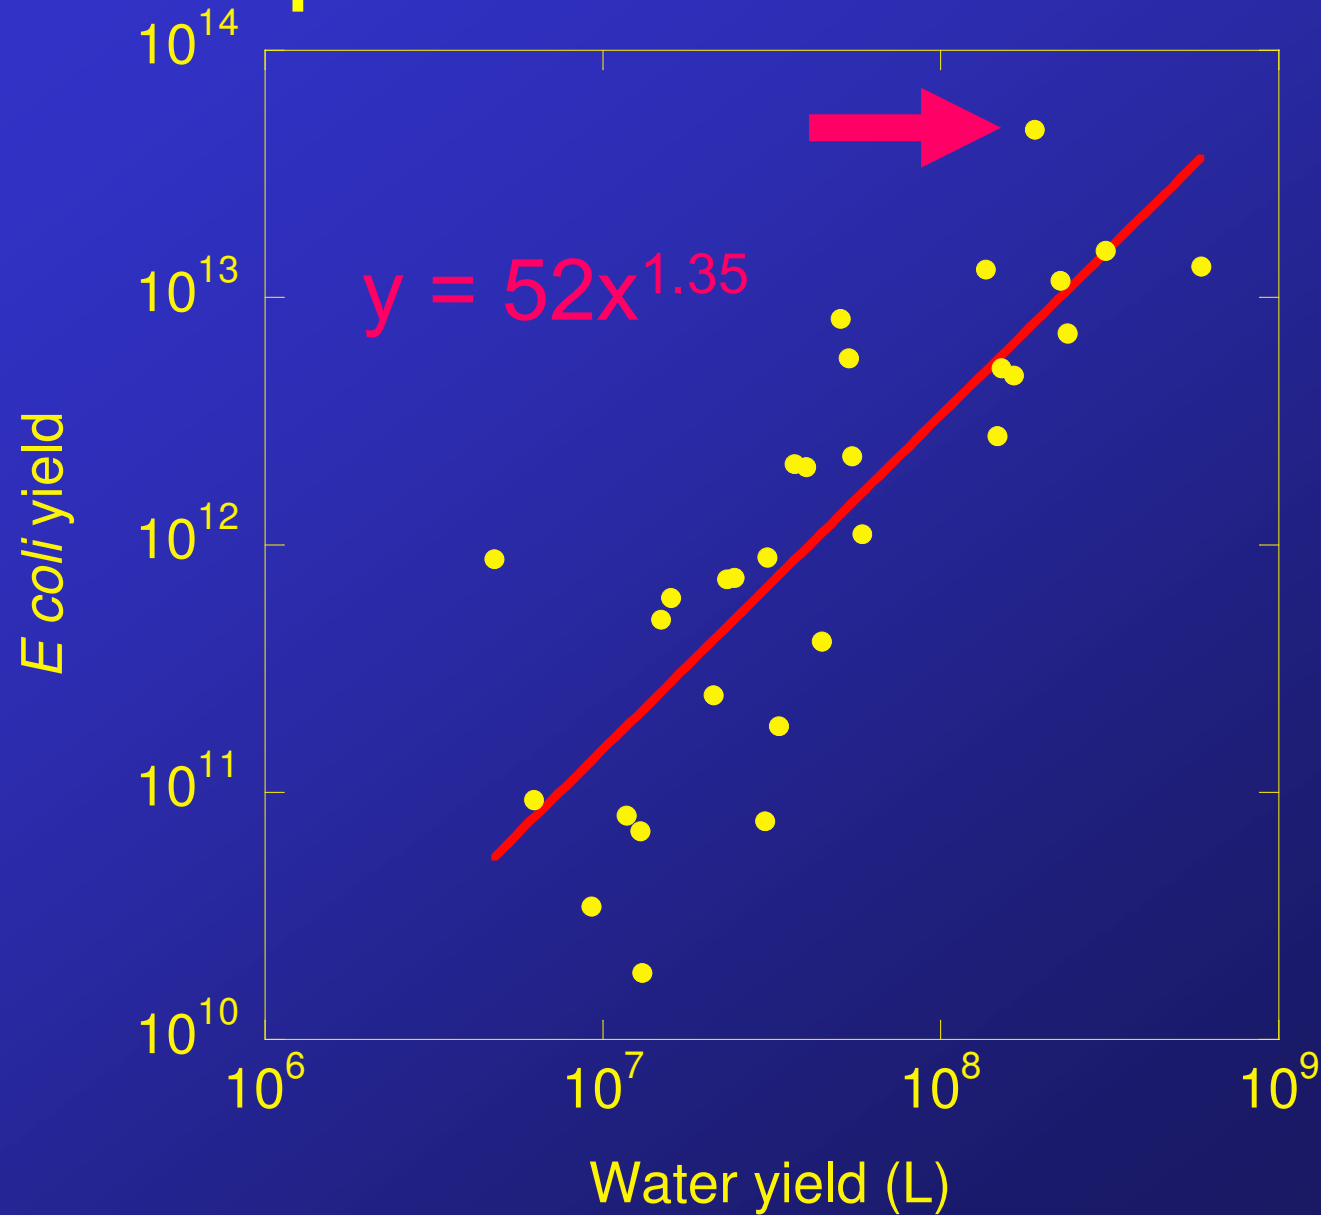

# Faecal pollution over a storm hydrograph (Toenepi, 18 Sept 2005)

# Toenepi – 30 storm events

# Toenepi – annual yields

	Yield (cfu)	%
Storm events	$1.5 \times 10^{14}$	95%
Base flow (76% of time)	$8 \times 10^{12}$	5%
Total	$1.6 \times 10^{14}$	100% *

\* 6 % of production @  $1.3 \times 10^9$  *E. coli*/cow/day

# Studying sediment uptake of faecal pollution - Flume experiments

Flume trial 1 (13-15 Feb 07)

# Shellfish contamination experiments – schematic

# Shellfish contamination experiment – obtaining an artificial river plume

# Conclusions – main take-home points

- **Pathways** of faecal contamination: overland flow and direct deposition
- **Sediments**: most stream contamination is in sediments – 1000X more than water
- **Stormflows** dominate faecal contamination yields – and contamination of downstream waters
- **Turbidity** is often a useful surrogate for faecal bacteria - exports of faecal pollution.
- **Current research**: flume studies of sediments stores, Experiments on shellfish contamination.
